## Presentation of the ECOPLANTMED project & the ENPI CBC MED Programme

The present edition was made possible by the project **ECOPLANTMED**: “ECOlogical use of native PLANTS for environmental restoration and sustainable development in the MEditerranean Region”.

The project aims to contribute to halting the loss of biodiversity and to promote a sustainable development model in the Mediterranean Region by enhancing the conservation of native plants and promoting their use in habitat restoration and the plant production sector.

This edition, as well as the '**ECOPLANTMED Manual for the propagation of selected Mediterranean native plant species**' and the '**ECOPLANTMED Guide of good restoration practices for Mediterranean habitats**' also produced by this project, are expected to become useful tools for native plants propagation, planning and implementation of restoration actions in all countries of the Mediterranean Basin.

The ECOPLANTMED project has a total budget of 1.050 million Euro and it is financed, for an amount of 0.945 million Euro (90%), by the **European Union under the ENPI CBC Mediterranean Sea Basin Programme 2007-2013**.

The European Union is made up of 28 Member States who have decided to gradually link together their know-how, resources and destinies. Together, during a period of enlargement of 50 years, they have built a zone of stability, democracy and sustainable development whilst maintaining cultural diversity, tolerance and individual freedoms. The European Union is committed to sharing its achievements and its values with countries and peoples beyond its borders.

ECOPLANTMED is one of the 95 projects funded under this Programme, a multilateral cross-border cooperation initiative financed by the European Neighbourhood and Partnership Instrument (ENPI), which involves 14 countries (Cyprus, Egypt, France, Jordan, Greece, Israel, Italy, Lebanon, Malta, Palestine, Portugal, Spain, Syria -participation currently suspended- and Tunisia). The Programme, managed by the **Autonomous Region of Sardinia on behalf of the European Commission and participating countries**, aims to promote a sustainable and harmonious cooperation process at the Mediterranean Basin level by addressing common challenges and enhancing the endogenous potential of the area. It has a total budget of 200 million Euro ([www.enpicbcmed.eu](http://www.enpicbcmed.eu)).

ECOPLANTMED project duration: January 2014 – December 2015

## PREFACE

The present edition is addressed mainly to seed germination laboratories, but it can also be useful for the nursery sector, both public and private, working with native plants suitable for restoration ecology and gardening in the Mediterranean biogeographic region.

The objective of this edition is to improve the knowhow on native plant species germination requirements. For more information concerning the selection of the species studied and the conditions for seed collection, curation and germination, please see the *ECOPLANTMED 'Manual for the propagation of selected Mediterranean native plant species'* (Ballesteros D, Meloni F, Bacchetta G (Eds.), 2015).

Here, the results of **the project seed germination experiments are presented in detail**, as performed at different conditions of photoperiod, temperature and substrate and with different pretreatments applied in the germplasm banks of all five project partners. Detailed data from 602 experiments are presented; these experiments concerned in total 104 taxa (i.e. average 6 experiments per taxon) and 151 new optimum germination protocols (germination percentages > 70%) were defined for 64 taxa for which optimum protocols were not previously published in the database of the Network of Mediterranean Plant Conservation Centres (GENMEDA). These germination results are expected to increase the ecological knowledge on the target plant species.
